Probes derived from the EPH-related PTKs Cek4 (Q90659) and Ce (Q90660) were used to isolate novel cDNA clones (Q90652-58, Q90661-62) from chicken embryo and embryonic brain libraries. Cek4 is highly expressed in the chicken developing brain and embryonic tissues and also in the adult brain and retina. Sequence 983 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Example; Fig 21; 194pp; English.

The present invention describes nucleic acid molecules for ror-1 ror-2, ehk-1 and ehk-2. Also described are the corresponding pro Ror-1; Ror-2; Ehk-1; and Ehk-2. The proteins are orphan receptor tyrosine kinases. The present sequence represents rat Ehk-2. Sequence 948 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (REGE-) REGENERON PHARM INC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              N-PSDB; T03100.

Agonist antibodies which activate specific protein tyrosine Agonist antibodies which activate proteins of kinase extracellular kinase(s) - also activate chimeric proteins of kinase extracellular domain and Ig constant domain, useful for studying, and therapeutic modulation of, cell growth and differentiation modulation of, cell growth and differentiation Disclosure; Page 95-99; 125pp; English.

DNA probes based on protein tyrosine-kinase (pTK) sequences were used to screen cDNA libraries to identify novel pTK genes. The bpTKs, bpTK1, bpTK2, bpTK3, bpTK4, bpTK5 and bpTK7 (R85924-28 and R85935, respectively) are expressed in human brain tissue and show homology to known pTKs. A full-length sequence for bpTK7 (R85936) was also obtd. bpTK7 can be used to design drugs that modulate pTK activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       obtd. by

                                                                                                                                    4 Novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7, HEK8 and HEK11 (R85089-92), respectively, were identified following isolation of their encoding cDNAs (702946-49) from a human foetal braccDNA library. :HEK5, HEK7 and HEK8 show extensive homology to the catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known EPH-like receptor. Recombinant HEK receptors (or their soluble extracellular domains) are produced be expression of encoding sequences in procaryotic or eucaryotic host cells, and are used to produce antibodies (utilised in diagnostic assays), or to identify and purify ligands for HEK receptors, or therespentically to modulate the activation of cell-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  New nucleic acid encoding EPH-like receptor tyrosine kinase(s) and related vectors, host cells, proteins, antibodies etc., us diagnostically and therapeutically to modulate receptor activa

The present sequence represents mouse Bsk, which is a receptor-like CC The present sequence represents mouse Bsk, which is a receptor-like CC tyrosine kinase. The nucleic acid sequence encoding Bsk can be used in CC Bsk nucleic acid probes, which can be used in detecting alterations in CC the level of Bsk messenger-RNA (mRNA) in biological samples isolated CC from a mammal afflicted with a disease, such as neurodegenerative CC diseases or disorders and neoplasms. The nucleic acid sequence can also be delivered into the limbic system of patients with limbic system CC neurodegenerative disease, disorder or injury to promote or enhance CC limbic system neuron regeneration or growth. Such neurodegenerative diseases include, chromosomal abnormalities, degenerative growth and CC development disorders, viral infections, bacterial infections, brain CC schizophrenia, or stroke and cerebral ischaemia.

Example; Fig 22; 194pp; English.

The present invention describes nucleic acid molecules for ror-1, ror-2, ehk-1 and ehk-2. Also described are the corresponding prot Ror-1; Ror-2; Ehk-1; and Ehk-2. The proteins are orphan receptor
                                                                                                                                                                                                                                                                                      Receptor tyrosine kinase; Ror-1; Ror-2; Ehk-1; Ehk-2; detection; neurotrophin activity; trkB; proto-oncogene; tyrosine kinase recbinding protein; BDNF; NT-3; diagnosis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 nucleic acid probes,

                                        treatment and diagnosis of neuronal disorders and angiogenesis related conditions.

Example 1: Page 50-53; 75pp: English.

Rat REK7 (R97853) is an eph-related tyrosine kinase receptor, for which AL-1 (see also W97854) is a ligand. Its amino acid sequence was deduced from a cDNA clone (R18893) isolated from a hippocampal cDNA library. An REK-TgG fusion was used to screen cultured cell lines for surface expression of REK7-binding activity. Primers (see also T44382-83) based on peptide sequences (R97856-59) of isolated ligands were used to amplify human breast carcinoma BTCO cell cDNA, and an amplified fragment was used to screen a human foetal brain cDNA library, leading to the isolation of AL-1 cDNA related:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           26-OCT-1995; U14016.

                                                                                                                                                                                                                                                                                                                                                              4 Novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7, HEK8 and HEK11 (R85089-92), respectively, were identified following cisolation of their encoding cDNAs (T02946-49) from a human foetal brain CDNA library. HEK5, HEK7 and HEK8 show extensive homology to the catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8. HEK11 shows no homology to any known EPH-like receptor. Recombinant HEK receptors (or their soluble extracellular domains) are produced by expression of encoding sequences in procaryotic or eucaryotic host cells, and are used to produce antibodies (utilised in diagnostic cels, or to identify and purify ligands for HEK receptors, or therapeutically to modulate the activation of cell-associated proliferation and/or differentiation of brain cells.

Claim 18; Page 71-75; 133pp; English.

CC 4 Novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7,

CC 4 Novel human EPH-like receptor protein tyrosine kinases, HEK5, HEK7,

CC 4 Novel human EPH-like receptors protein tyrosine kinases, HEK7,

CC HEK8 and HEK11 (R85089-92), respectively, were identified following

CC isolation of their encoding cDNAs (T02946-49) from a human foetal brain

CC CDNA library. HEK5, HEK7 and HEK8 show extensive homology to the

CC catalytic domain of chicken EPH-like receptors Cek5, Cek7 and Cek8.

CC HEK1 shows no homology to any known EPH-like receptor. Recombinant

CC HEK receptors (or their soluble extracellular domains) are produced by

CC expression of encoding sequences in procaryotic or encaryotic host

CC cells, and are used to produce antibodies (utilised in diagnostic

CC assays), or to identify and purify ligands for HEK receptors, or

CC therapeutically to modulate the activation of cell-associated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      RESULT

CDNA cloning using adult mouse brains and Northern blotting identified 2 truncated versions, MDK1 T1 (W03422) and MDK1 T2 (W03423), of the novel mouse developmental kinase 1 (MDK1) (see al W03423), of the movel mouse developmental kinase 1 (MDK1) (see al kinases. Their amino acid sequences were deduced from cDNA clones (T32961 and T32962) obtd. from adult mouse brains. MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDK1, but lack the catalytic tyrosine kinase domain. They can be used to screen for potential agents useful for treatment of diseases characterised by abnormal signal transduction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New mouse development kinase 1 gene - used 1 diagnosis and treatment of abnormalities in

Example 1; Page 113-115; 128pp; English.

CDNA cloning using adult mouse brains and Northern blotting identified 2 truncated versions, MDK1 T1 (W03422) and MDK1 T2 (W03423), of the novel mouse developmental kinase 1 (MDK1) (see als W03421), a new member of the eck/eph family of receptor tyrosine kinases. Their amino acid sequences were deduced from cDNA clones (T32961 and T32962) obtd. from adult mouse brains. MDK T1 and T2 each possess the entire ectodomain, the transmembrane domain and part of the juxtamembrane region of MDK1, but lack the catalytic tyrosine kinase domain. They can be used to screen for potential

Mouse developmental kinase 1 (MDKI) (W03421) is a new member of eck/eph family of receptor tyrosine kinases (RTKs). Its amino acid sequence was deduced from a cDNA clone (T32960) isolated from mouse embryo and adult brain libraries. The distinct patterns of MDK1 expression during mouse development suggest an important role for MDK1 in the formation of neuronal structures. It can be used in methods for the diagnosis of diseases characterised by abnormality in a signal transduction pathway, such as neuroproliferative or neurodegenerative disorders or cancer, to screen for (ant)agonists, and to raise antibodies.
                                                                                                                                                                                                                                                                                                                                                   to screen

Eph-related protein tyrosine kinase(s) - for monitoring and diagn cancer.

Claim 11; Page 71-75; 129pp; English.

Claim 11; Page 71-75; 129pp; English.

A cDNA clone encoding a novel variant of EPH-related PTK Cek5,

Cek5+ (Q90657), was isolated from a chick embryo library in lambda gtll. Cek5+ protein (R75709) contains a 16-amino acid insertion in the juxtamembrane domain, and be a result of alternative splicing. Cek5+ is exclusively expressed in the CNS. Sequence 1011 AA;

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

TISSUE SPECIFICITY: WITHIN THE NERVOUS SYSTEM, EXPRESSION IS TISSUE SPECIFICITY: WITHIN THE NERVOUS SYSTEM, EXPRESSION IS RESTRICTED TO PROSOMERES I AND 2 IN THE DIENCEPHALON AND ALL THE RHOMBOMERES IN THE HINDBRAIN DURING SEGMENTATION STAGES. LATER ON, A SUPERLINGSED PATTERN APPEARS THAT CORRELATES WITH THE FORMATION OF SEVERAL AXONAL TRACTS. IN THE SOMITIC MESODERM, THE EXPRESSION CORRELATES WITH SEGMENTATION AND THE GUIDANCE OF BOTH NEURAL CREST AND MOTOR AXONS THROUGH THE SCLEROTOMES.

-!- DEVELOPMENTAL STAGE: MATERNALLY EXPRESSED, IT DECREASES AT MID BLASTULA TRANSITION AND REAPPEARS AT LATE MEDURULATION. EXPRESSED AT HIGHER LEYELS IN THE ANTERIOR AND DORSAL REGIONS OF EMBRYONIC STAGES 16, 24 AND 37. IN ADULT IT APPEARS TO BE UBIQUITOUSLY EXPRESSED WITH HIGHER EXPRESSION IN BRAIN AND OYARY. EXPRESSION ITHE BRAIN, BRACHIAL ARCHES, TRIGEMINAL FACIAL GANGLION, AND THE RETINA OF SWIMMING TADPOLE STAGE OF DEVELOPMENT.
-!- SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALLYTIC DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.
-!- SIMILARITY: CONTAINS 1 IMMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.
-!- SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TYROSINE PHOSPHATE.

SUBCELLULAR LOCATION: TYPE I MEMBRANE PROTEIN.

SUBCELLULAR LOCATION: TYPE IN THE EMBRYO IN PRE-SOMITIC MESODERM, CAUDAL SOMITIES, MIDBRAIN, AND CEMENT GLAND. MOST ABUNDANT IN ADULT BRAIN, EYE, HEART, LUNG AND OVARY. LOWER LEVE IN INTESTINE, KIDNEY, OVIDUCT AND PHARYIN.

DEVELOPMENTAL STAGE: EXPRESSED DURING EARLY DEVELOPMENT.

SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.

SIMILARITY: CONTAINS 1 INMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.

SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAIN.

MOST ABUNDANT IN ADULT BRAIN, WITH LOWER LEVELS IN EYE, HEART, OVARY OVIDICT, LUNG AND PHARYNX.

-!- DEVELOPMENTAL STAGE: EXPRESSED DURING EARLY DEVELOPMENT.
-!- SIMILARITY: TO OTHER PROTEIN-TYROSINE KINASES IN THE CATALYTIC DOMAIN. BELONGS TO THE EPHRIN RECEPTOR FAMILY.
-!- SIMILARITY: CONTAINS 1 IMMUNOGLOBULIN-LIKE C2-TYPE DOMAIN.
-!- SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
-!- SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
-!- SIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
-- BIMILARITY: CONTAINS 2 FIBRONECTIN TYPE III-LIKE DOMAINS.
